TO DETERMINE PREGNANT'S WOMEN OF THE KNOWLEDGE ABOUT HIGH RISK PREGNANCIES IN THE WORKING AREA OF PUSKESMAS CEPOGO, DISTRICT BOYOLALI	
ABSTRACT Background: High risk pregnancy in Indonesian is a pregnancy which can cause complications that cause death in pregnant women. With maternal mortality rates increasing year by year in cepogo health center from 2017 reached 2 cases of maternal mortality with 250 high risk pregnant women, this increase in cases of high risk pregnancy is due to the lack of knowledge of pregnant women. Aim: describes the level of knowledge of pregnant women about high risk pregnancy in the work area of cepogo health centers. Method: this type of research is descriptive, research population of 250 with sampling proportionate stratified random sampling the samples obtained were 71 respondents. Instrument research using questionnaire sheet. Data analysis using univariate analysis. Results: Analysis univariate results revealed that the majority of pregnant women age less than 20 years old, the education of pregnant women is the majority of basic education (SD/ SMP), income level of majority pregnant women > 1.000.000,00. Description of the knowledge of pregnant women about high risk pregnancies in the working area of the Cepogo health center is the majority have less knowledge of 49 respondents (69,0%). Conclusion: a description of the knowledge of pregnant women about high risk pregnancies in the work area of cepogo health center is still lacking.
