SUMMARY

Background: *Bronchopneumonia or lobular pneumonia is an inflammation of the lung parenchyma which usually affects the bronchioles and surrounding alveoli and often affects children and toddlers. Bronchopneumonia is caused by bacteria, viruses, fungi and foreign bodies. If not treated properly, it can cause acute complications in the form of suppuration (lung abscess or empyem thoracis). Treatment options in children with bronchopneumonia consist of pharmacological therapy including antibiotic therapy and non-pharmacological therapy in the form of symptomatic therapy such as analgesic, antipyretic***Objective:** *It is hoped that the provision of nebulizer therapy provides education about nebulizer therapy that has benefits for the community, adding education about giving nebulizers to patients with bronchopneumonia.***Conclusion:** *Video can provide information to increase knowledge about nebulizer therapy to overcome airway clearance in bronchopneumonia patients as a therapy that is easily practiced independently by the community so that it can assist patients in assisting patients in removing secretions and clearing the airway with better frequency that can be seen. on social media via smartphones.*

Keywords : *Bronchopneumonia, Nebulizer, Video Media*
