**SUMMARY**

**Background:** *Stunting is a condition in children with growth failure or delayed growth due to chronic malnutrition. Growth failure or stunting is associated with malnutrition since the baby is in the womb and in the early period after birth. Prevention of stunting requires integrated nutritional interventions, which include specific and sensitive nutritional interventions, needed to prevent stunting.*  
**Objective:** *Improving the nutritional status of toddlers by providing additional food to toddlers who are indicated as stunting.*  
**Method:** *Efforts to prevent stunting through Supplementary Feeding activities by monitoring and evaluating in supporting stunting prevention activities.*  
**Results:** *Supplementary Feeding carried out from September to November 2023 has proven effective in reducing the number of stunted toddlers from 16 to 3 toddlers.*  
**Conclusion:** *Community service activities with the Bumi Ceting program can have a significant impact on improving the nutritional status of stunted toddlers and reducing stunting rates in Bumi Laweyan sub-district.*

**Keywords:** *Stunting, Nutrition, Additional Food Provision*
