**ABSTRACT**

*The most common accident in healthcare is needlestick injuries, where a needle used on a patient punctures the skin of a healthcare worker. A therapist is an expert in performing various types of treatments in a beauty clinic, a person who has received education and training in the field of beauty from a government-recognized beauty education and training institution, also called a skin, body, and other beauty stylist. Needlestick Injury (NSI) is an injury that occurs due to being stabbed or cut by a sharp or pointed object. Knowledge is a collection of information, facts, abilities, and understanding acquired by an individual through experience, learning, or research. The purpose of this study was to determine the description of therapists' knowledge in preventing needlestick injuries. This study was conducted using a quantitative method with descriptive research. The sampling technique in this study was a total sampling of 30 respondents. Based on the results of the study, therapists' knowledge in preventing needlestick injuries at the Vorta Beauty Clinic in Palembang was good knowledge of 74% and, sufficient knowledge of 26%, and poor knowledge was 0*
