SUMMARY / SUMMARY

Pregnancy health problems that often occur in pregnant women, one of which is pre-eclampsia, the *Maternal Mortality Rate* (MMR) is an indicator to see the degree of health, but every day around 830 mothers die from preventable causes related to pregnancy and childbirth. Nearly all maternal deaths (99%) occur in developing or low-income countries. Preeclampsia is a condition in which pregnant women experience hypertension, edema or proteinuria that occurs after 20 weeks of gestation. Health arises because of a lack of knowledge of someone in maintaining his health. Based on the above problems, the writer has an idea or idea to make a poster entitled "Recognize Pre-eclampsia to Prevent Death in Pregnant Women". This poster is expected to provide information and education to pregnant women about maternal health education and increase education about pregnancy.

Pre-eclampsia posters in pregnant women are made for the community, especially for women, in order to know the meaning of pre-eclampsia, types of pre-eclampsia, risk factors for pre-eclampsia, the impact of pre-eclampsia and prevention of pre-eclampsia. It is hoped that with this socialization media, it can reduce the death rate caused by pre-eclampsia.
