ESSENCE

Diaper rash is a common problem in babies, especially newborns. Diaper rash usually occurs in babies characterized by reddening of the skin on the buttocks and genitals, caused by irritated skin, especially in newborns who are sensitive to irritants. This can happen if the diaper is changed late, the diaper is too rough and doesn't absorb sweat, and a fungal or bacterial infection. This rash will disappear within a few days if smeared with olive oil. Diaper Rash occurs in areas that are moist and warm because in areas that are moist and warm it can trigger the growth of bacteria, plus blisters due to friction which reduce the effectiveness of the skin barrier, causing diaper rash.

The method used is in the form of an output, namely a poster with the title "Olive Oil Is Effective For Overcoming Diaper Rose In Children 0-36 Monthns".

The result of this research was a poster educational media entitled "Olive Oil Is Effective For Overcoming Diaper Rose In Children 0-36 Monthns".
