

ABSTRACT

Background: Hallucinations are defined as disturbance of a person's sensory perception, where there is no stimulus. One type of hallucination is auditory-hearing voices or sounds. The impact caused by hallucination patients is to lose self-control. To minimize the impact caused by hallucinations, one of the treatments is using occupational drawing therapy. Occupational therapy is a science and art of adjusting abilities that have been liked and possessed by patients, directing one's participation to carry out certain tasks with the aim of restoring mental function. Objective: to find out the results of applying occupational therapy to draw signs and symptoms in auditory hallucination patients at Larasati Ward, RSJD dr. Arif Zainuddin Surakarta. Methods: The design of this study uses the case study method with a nursing process approach that focuses on optimizing nursing interventions in patients with auditory hallucinations. Result: the results of the application show that the two respondents experienced developments which were initially classified as very severe and severe hallucinations, to moderate and mild hallucinations. Conclusion: the condition of the two respondents showed a decrease in the level of hallucinations
