ABSTRACT

Background: Landslide disasters are in fourth position with 5.6% of all disaster events in the world. According to BPBD, there were 67 landslide disasters that occurred in Poncol Magetan. Anxiety is one of the negative impacts of landslides. Anxiety often occurs in the elderly because as they get older they experience physical and psychological decline. **Objective:** to determine the anxiety level of elderly people regarding the landslide disaster in Poncol Magetan. With the specific aim of describing the characteristics of respondents (Age, Gender, Education) and describing the level of anxiety of the elderly towards the landslide disaster area in Poncol Magetan. **Method:** the type of research used is descriptive quantitative analysis research, where the data collection technique is purposive sampling. The research instrument used the GAS (Geriatric Anxiety Scale) questionnaire with a sample size of 75 respondents. **Results:** The results of the study showed that the majority of elderly were aged 60-69 years (young old), female, had elementary school education, and moderate anxiety levels were 37 (54,4%) elderly. **Conclusion:** The anxiety level of the elderly regarding the landslide disaster in Poncol Magetan shows that it is in the medium category.

Keywords: *Anxiety level, landslide, elderly*
