**ABSTRACT**

**Background:** Sebrang Lor Village is one of the villages located in Mojosongo Village, Jebres District, Surakarta City. The village falls within the Sibela Community Health Center's working area, which is frequently affected by flooding from the Bengawan Solo River. Floods caused by piles of garbage lead to stagnant water and the spread of diseases, one of which is diarrhea. The high number of diarrhea cases after the flood encouraged health workers to provide services through mobile health centers. **The Objective of the Research:** To find out the overview of residents' knowledge about preventing diarrhea in areas affected by flooding. **Methods:** This research used a descriptive method with a quantitative approach. The population consisted of 106 respondents and a sample of 56. The research instrument used was a questionnaire with univariate analysis. **Result:** The majority of respondents in this study were women, in their early twenties, with a high school/vocational high school education, and private sector employees. The community's knowledge level was in the good category, there were 47 respondents (83.9%). **Summary:** Overview of residents' knowledge about preventing post-flood diarrhea in Sebrang Lor Village Rt05/Rw08 is in the good category.
